1 Firebird database server installation

1.1 Download the installer

- 👉 Download the Firebird 2.5 database server installer, which can be found on its official website <http://www.firebirdsql.org/en/downloads/> under the “Server Packages” category. There are several variants to choose from for 32-bit and 64-bit systems.
- 👉 Download the variant “Classic, Superclassic&Superserver – Windows executable installer for full Superclassic/Classic or Superserver, recommended for first-time users” according to your system.
- 📌 *This guide covers installing Firebird version 2.5.8. in the SuperClassic version.*

1.2 Firebird installation

- 👉 After running the installer, you may be asked by the system if you want to allow the installer to make changes to your computer – select “Yes”.

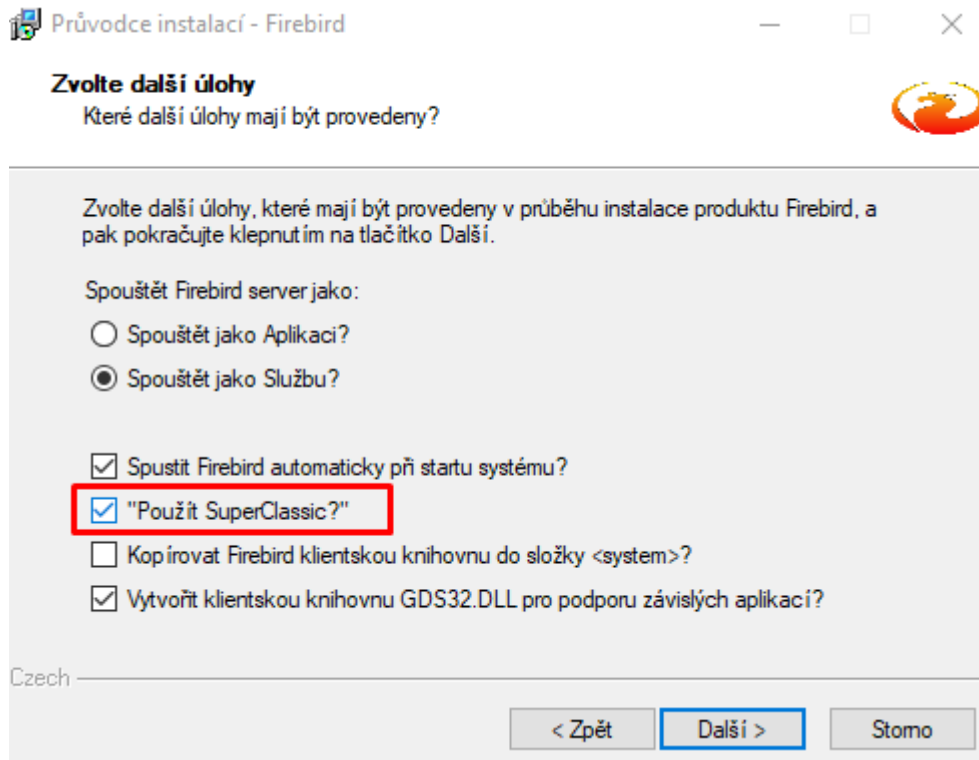

- 👉 In the next step, select the required installation language, read and agree to the license agreement, and select the location where you want to install Firebird.
- 📌 *The default path is “C:\ProgramFiles\Firebird\Firebird_2_5”, do not change this path.*

Next, select **“Classic server binary”** – this option is not checked by default.

↳ In the next step, select **“Use SuperClassic”** – this option is not checked by default.

↳ During the installation of the Firebird database server, it is possible to set the server to three versions – “Classic”, “SuperClassic” and “SuperServer”. One of the main differences between the three versions is the number of instances of the processes used. The “Classic” version creates a separate “fb_inet_server.exe” process for each client that accesses the Firebird database. The “SuperClassic” version creates one “fb_inet_server.exe” process for all users with a number of threads that corresponds to the number of logged in users. The latest version of “SuperServer” creates only one single-threaded “fb_server.exe” process for all users.

↳ **For example, for 50 users logged in to NET Genium is:**

- In the “Classic” version, 50 “fb_inet_server.exe” processes have been created.
- In the “SuperClassic” version, one process “fb_inet_server.exe” with 50 threads.
- In the “SuperServer” version, one process “fb_server.exe” with one thread.

i We recommend the “SuperClassic” version when installing the Firebird database server for NET Genium.

↳ At the end of the installation, an overview of the items that will be installed will be displayed. Click the “Next” button and select **“Install”**.

1.3 Additional settings

1.3.1 Creating a “Classic.txt” file

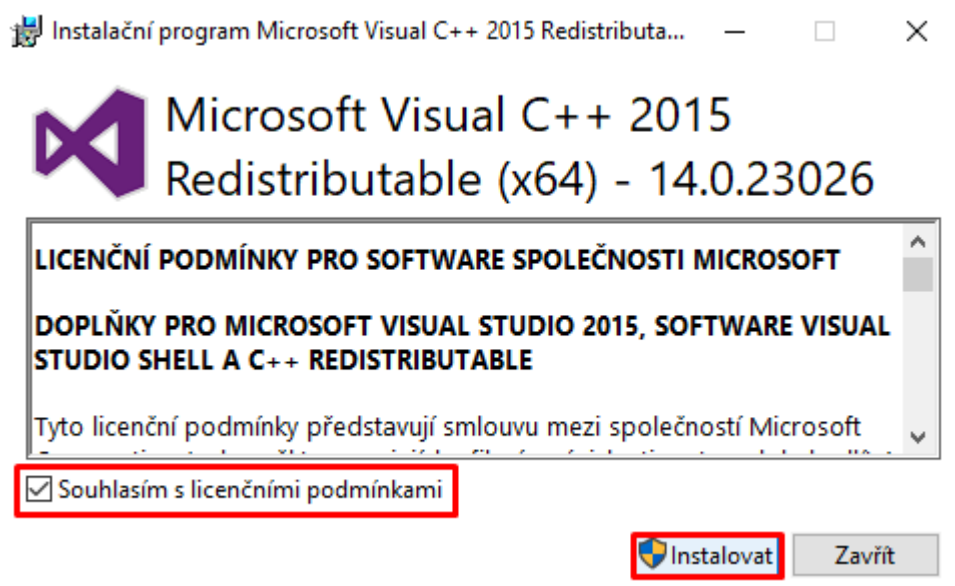

- ↳ Create a “Classic.txt” file in the data directory where you want to store all your Firebird databases, eg “C:\Firebird\Classic.txt” (the content of this file does not matter).
- ❗ *In order for NET Genium to be able to identify the version of the Firebird database without having to search the processes running on the system, it is necessary to insert the “Classic.txt” file into the “Firebird” directory (where the individual databases are stored). If the “Classic.txt” file is stored in the “Firebird” directory, NET Genium automatically knows that it is a “Classic” or “SuperClassic” version.*
- ❗ *Each time the database structure is changed (adding a new column, renaming a column, changing a column data type, deleting a column), NET Genium will try to identify the “Classic” or “SuperClassic” version by searching for the “Classic.txt” file. If this file is found, NET Genium will try to synchronize the new database structure in all processes or threads by running the “FbConnection.ClearPool” command. In fact, this means that all currently open connections to the database are closed and the “connection pool” is emptied. If any of these connections are actively in use at the same time, the “FbConnection.ClearPool” command will fail and the error message “Update Firebird metadata cache failed. Please run FbConnection.ClearPool manually.” will be displayed. This error message does not limit the administrator who initiated the database structure change. Its thread has changed structure, so its thread is already out of sync. Only other users could see error messages such as “Column not found in database” and so on. Usually, you just have to wait a while for other users' threads to sync. **If this does not happen for a long time and the situation needs to be addressed urgently, it is possible to run the “FbConnection.ClearPool” command manually directly from the NET Genium tools.***

1.3.2 Installing the library “ngudf.dll”

- ↳ The “ngudf.zip” archive is located in the “bin” directory of NET Genium. The contents of this archive are files “**ngudf.dll**” and “**download-and-install.txt**” – separately in folders for 64-bit and 32-bit systems. Depending on your system **copy the file “ngudf.dll” to the directory “UDF”** where you have Firebird installed (eg “C:\ProgramFiles\Firebird\Firebird_2_5\UDF”).

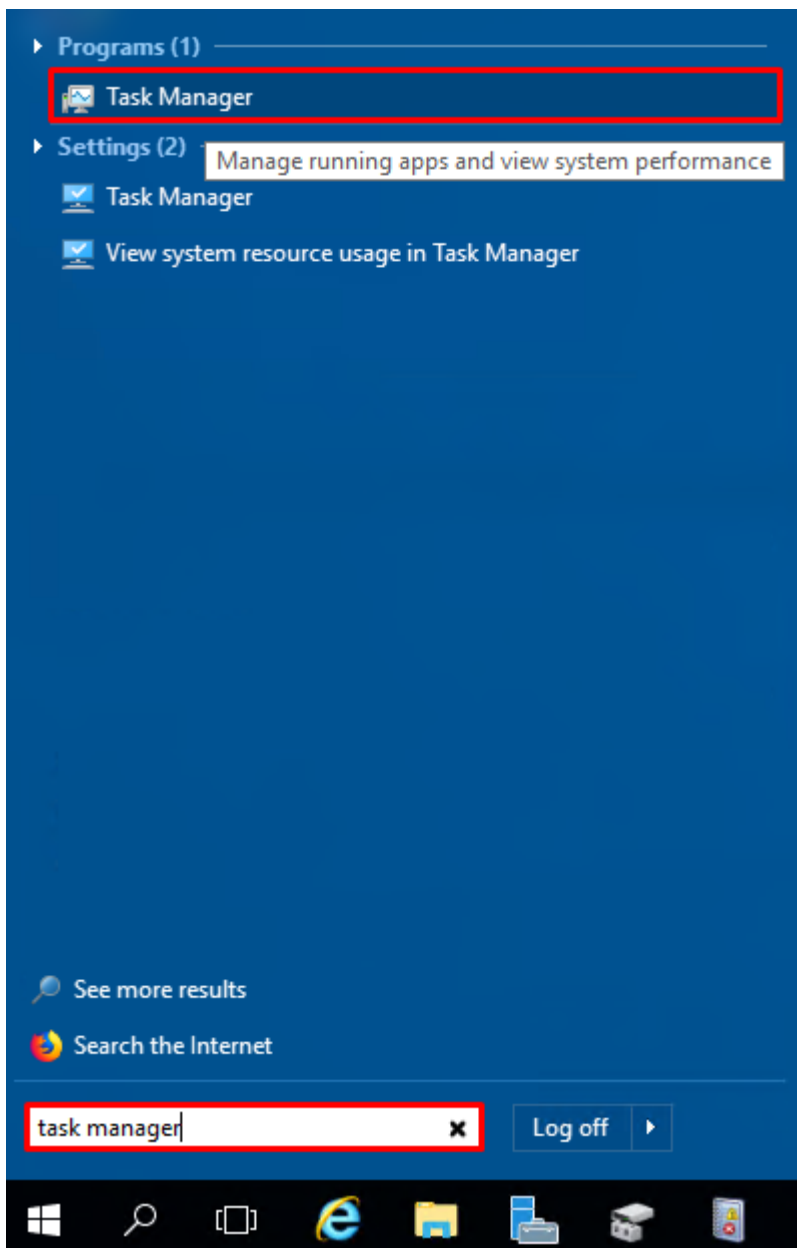

1.4 Installing Microsoft Visual C++ 2015 Redistributable (vc_redist)

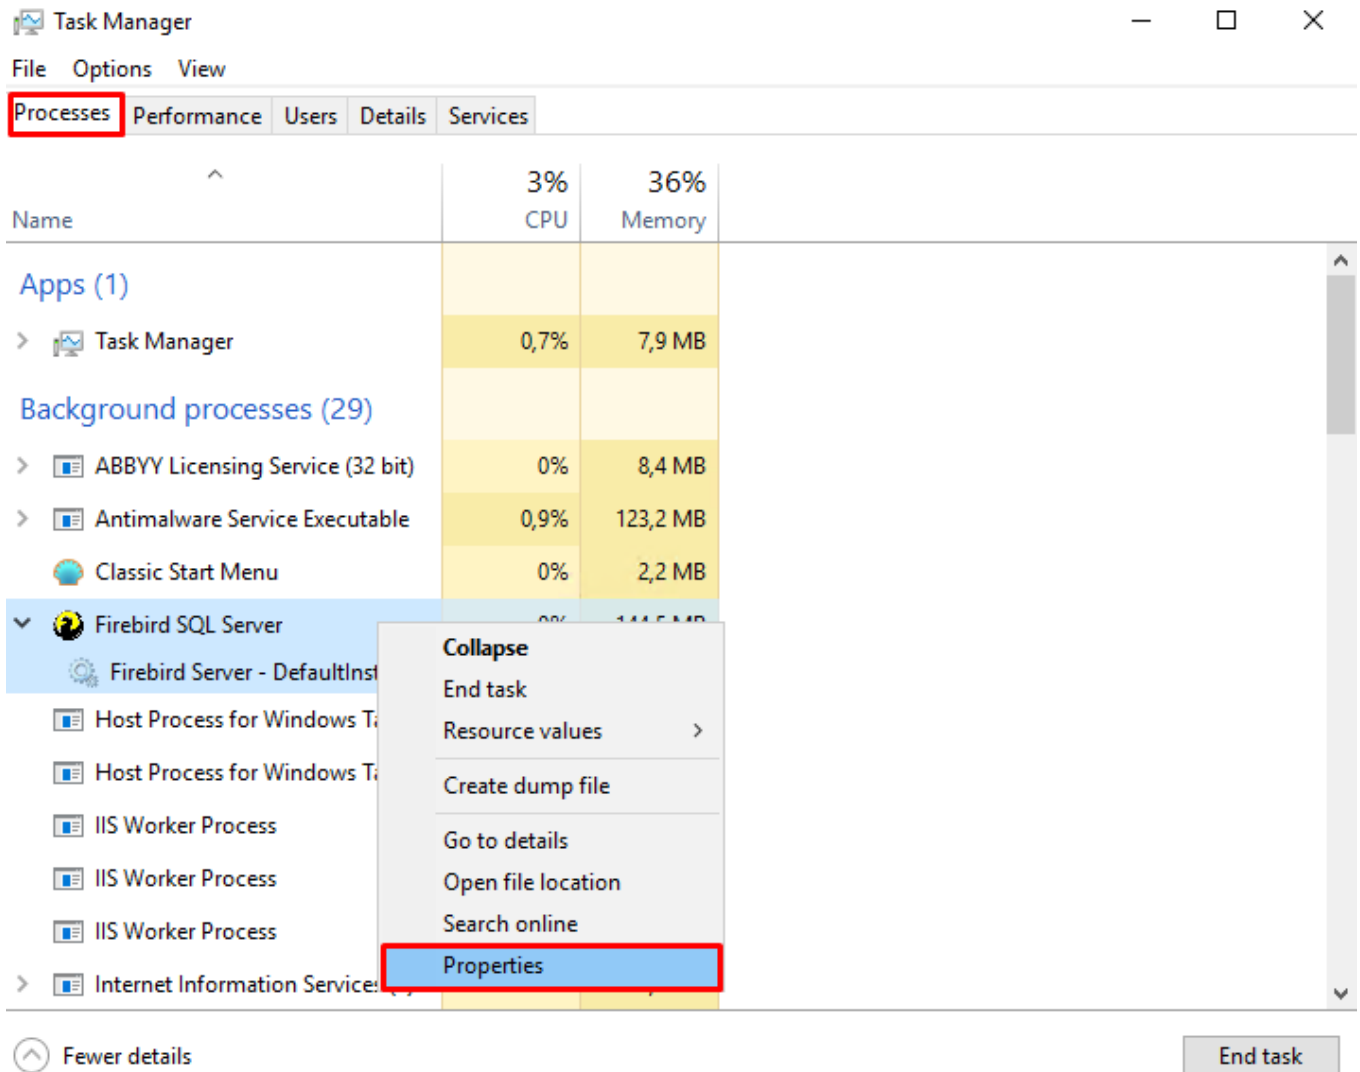

- Download “vc_redist.x64” or “vc_redist.x86” according to your operating system.
https://www.netgenium.com/download/vc_redist.x64.exe
https://www.netgenium.com/download/vc_redist.x86.exe
- Run “vc_redist.x64” or “vc_redist.x86” depending on your operating system version.
- Read and then agree to the license terms and click the button **“Install”**.

1.5 Determining the version of the Firebird database server

- ☞ If the Firebird database server has been installed on your computer or server for some time and you need to find out which version it is, start the “Task Manager” application and find the “Firebird SQL Server” process here, click on it right-click and select “Properties”.

Task Manager

File Options View

Processes Performance Users Details Services

Name	3% CPU	36% Memory
Apps (1)		
Task Manager	0,7%	7,9 MB
Background processes (29)		
ABBY Licensing Service (32 bit)	0%	8,4 MB
Antimalware Service Executable	0,9%	123,2 MB
Classic Start Menu	0%	2,2 MB
Firebird SQL Server	0%	144,5 MB
Firebird Server - DefaultInst		
Host Process for Windows T		
Host Process for Windows T		
IIS Worker Process		
IIS Worker Process		
IIS Worker Process		
Internet Information Services		

Context menu for Firebird SQL Server:

- Collapse
- End task
- Resource values >
- Create dump file
- Go to details
- Open file location
- Search online
- Properties**

Fewer details End task

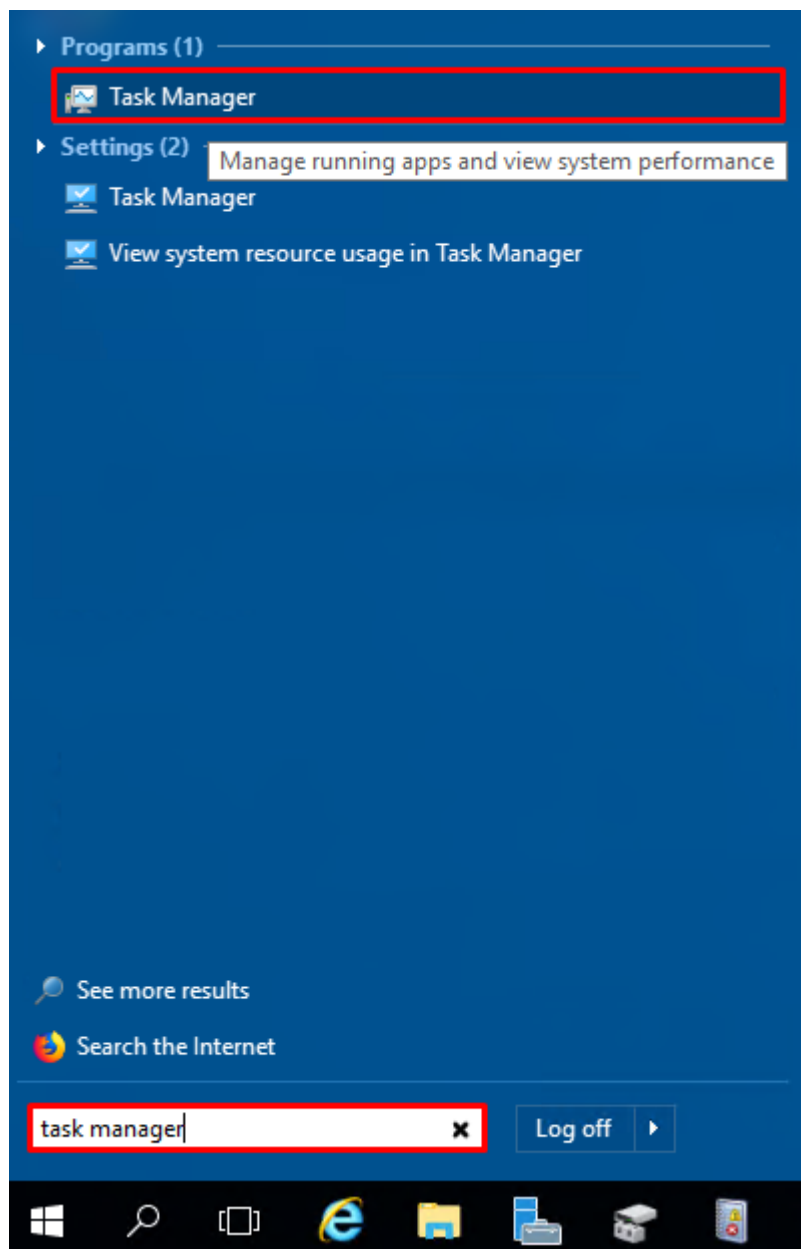

i If multiple instances of the Firebird database process are found in the list, this is the “Classic” version.

- ➔ Go to the “General” tab and see what is listed in the process name. If indicated “**fb_inet_server.exe**”, this is the “SuperClassic” version, but if “**fb_server.exe**”, this is the “SuperServer” version.

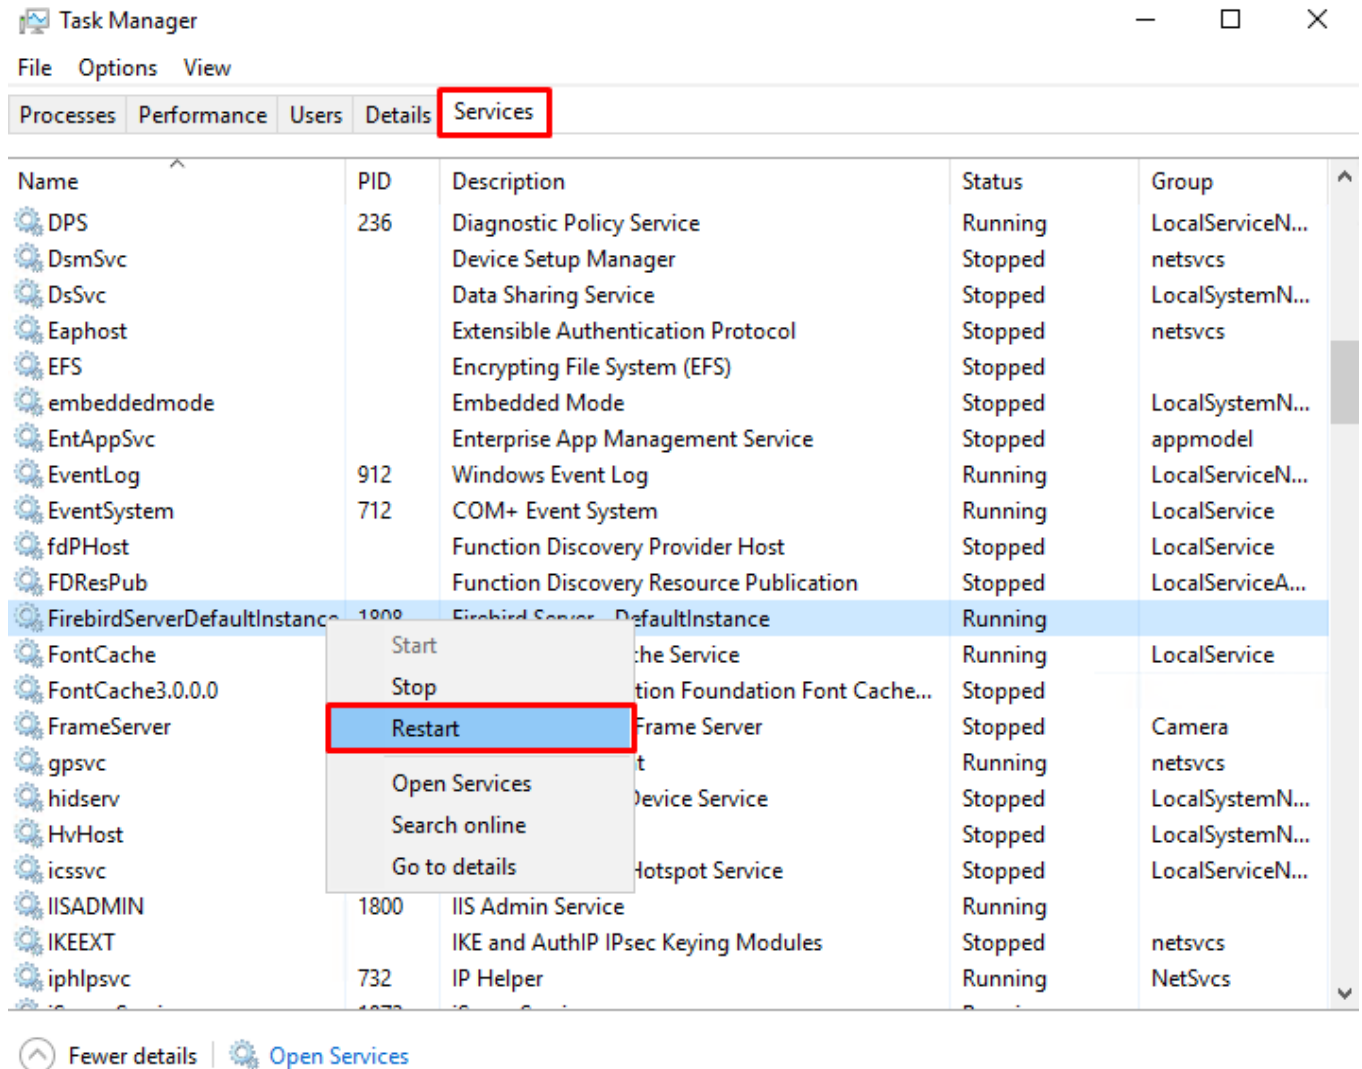

1.6 Restart the Firebird database server

👉 If for some reason it is necessary to restart the Firebird database server, start the “Task manager” application.

👉 Then you need to select the “Services” tab and right-click on “FirebirdServerDefaultInstance” from the list of services. Then all you have to do is select an option from the menu that appears **“Restart”**.

⚠ In some cases, it will only happen that the service will be stopped, so it is then necessary to press "Start".

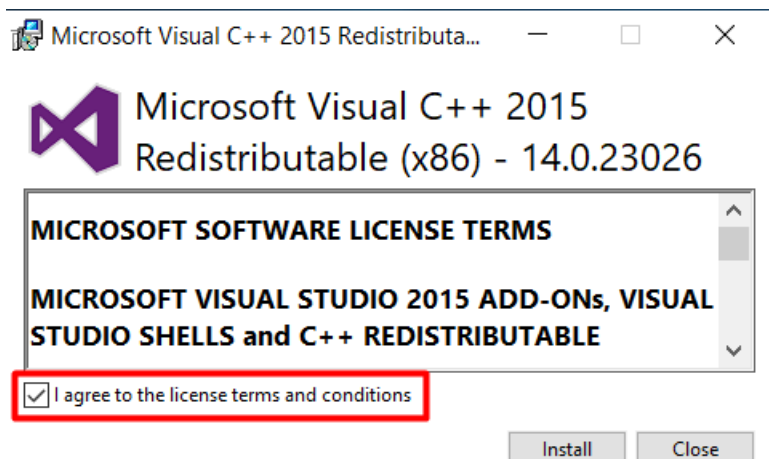

The screenshot shows the Windows Task Manager application with the 'Services' tab selected. A context menu is open over the 'FirebirdServerDefaultInstance' service, which is currently 'Running'. The 'Restart' option in the menu is highlighted with a red box. The 'Services' tab label at the top is also highlighted with a red box.

Name	PID	Description	Status	Group
DPS	236	Diagnostic Policy Service	Running	LocalServiceN...
DsmSvc		Device Setup Manager	Stopped	netsvcs
DsSvc		Data Sharing Service	Stopped	LocalSystemN...
Eaphost		Extensible Authentication Protocol	Stopped	netsvcs
EFS		Encrypting File System (EFS)	Stopped	
embeddedmode		Embedded Mode	Stopped	LocalSystemN...
EntAppSvc		Enterprise App Management Service	Stopped	appmodel
EventLog	912	Windows Event Log	Running	LocalServiceN...
EventSystem	712	COM+ Event System	Running	LocalService

iphlpvc	732	IP Helper	Running	NetSvc

2 FlameRobin installation

2.1 Installing Microsoft Visual C++ 2015 Redistributable (vc_redist)

- 👉 Download “vc_redist.x86”.
https://www.netgenium.com/download/vc_redist.x86.exe
- 👉 Run “vc_redist.x86”.
- 👉 Read and then agree to the license terms and click the button **“Install”**.

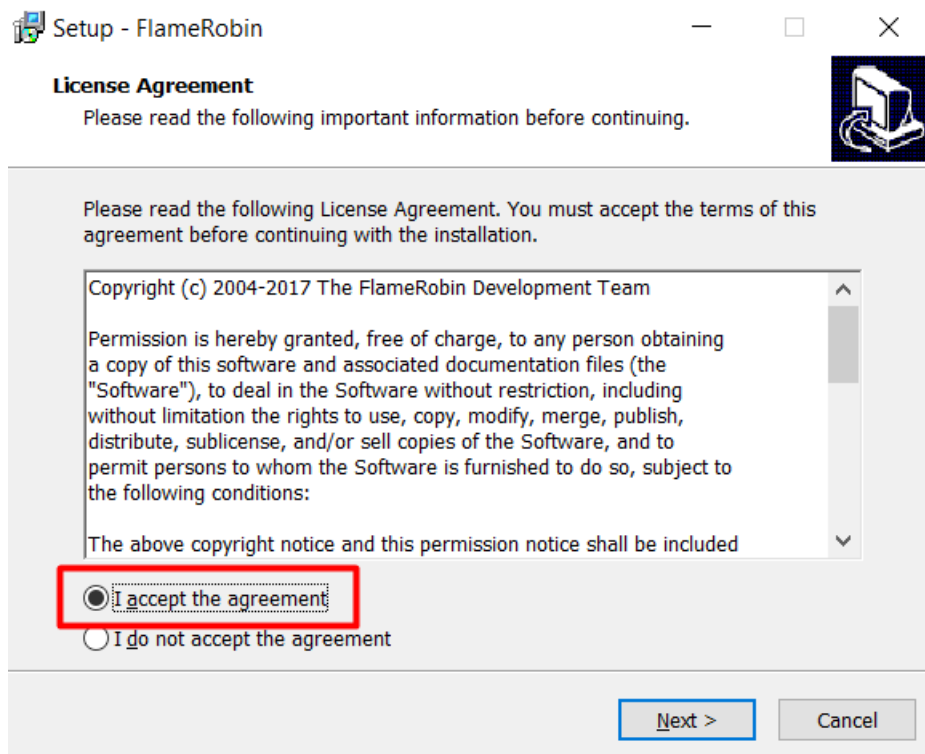

2.2 Download the installer FlameRobin

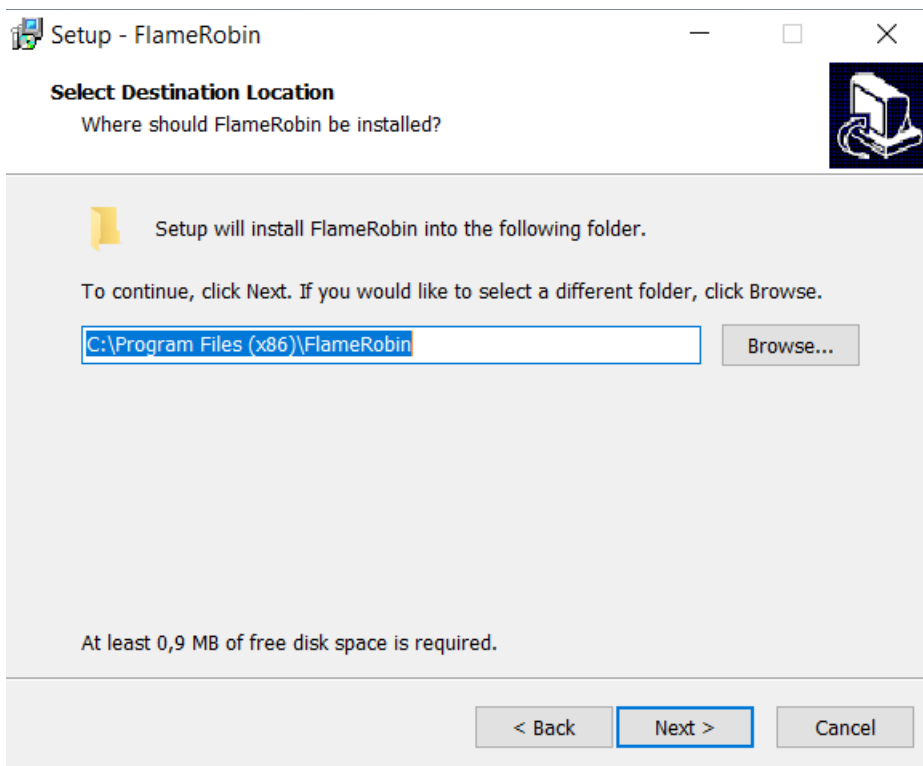

- Download the FlameRobin installer, which can be found at:
<http://www.flamerobin.org>

2.3 FlameRobin installation

- Read and agree to the license terms and click the button **"Next"**.

☞ Select the location where you want to install FlameRobin and click the button **“Next”**.

❗ You can then choose whether to place a program shortcut in the “Start” menu and an icon on the desktop.

☞ Click the button **“Install”**

⚠ *To continue using FlameRobin, you must create or register your new database server and its database.*

2.4 Registration of an existing database

▲ *To register an existing database, you must first have NET Genium installed.*

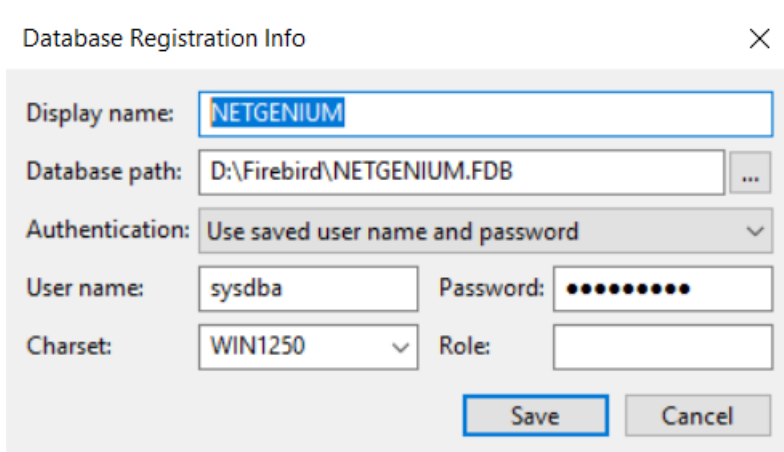

🔗 In FlameRobin, click on “Database” and select “Register existing database...”.

↳ **Fill in:**

- The path where you have the database stored
- Your database name (filled in automatically if you select the database path as the first step)
- Username **"sysdba"**
- Password **"masterkey"**
- Charset **"WIN1250"**

↳ Click the button **"Save"**.

The screenshot shows a dialog box titled "Database Registration Info" with a close button (X) in the top right corner. The dialog contains the following fields and controls:

- Display name:** A text box containing "NETGENIUM".
- Database path:** A text box containing "D:\Firebird\NETGENIUM.FDB" with a browse button (three dots) to its right.
- Authentication:** A dropdown menu set to "Use saved user name and password".
- User name:** A text box containing "sysdba".
- Password:** A text box containing ten black dots.
- Charset:** A dropdown menu set to "WIN1250".
- Role:** An empty text box.
- Buttons:** "Save" and "Cancel" buttons at the bottom.
